Open problems

The free-energy functional

We take into account of elasticity effects by choosing

$$\begin{aligned} \underline{\Psi}(\vartheta, \varepsilon(\mathbf{u}), \chi, \nabla\chi) &= c_V \vartheta (1 - \log \vartheta) - \frac{\lambda}{\vartheta_c} (\vartheta - \vartheta_c) \chi \\ &+ \frac{(1 - \chi) \varepsilon(\mathbf{u}) \mathcal{R}_e \varepsilon(\mathbf{u})}{2} + W(\chi) + \frac{\nu}{2} |\nabla\chi|^2 \end{aligned}$$

- ▶ $\varepsilon(\mathbf{u})$ the **linearized symmetric strain tensor**, namely $\varepsilon_{ij}(\mathbf{u}) := (u_{i,j} + u_{j,i})/2$, $i, j = 1, 2, 3$
- ▶ $(1 - \chi)$ the local proportion of the **non viscous phase**, e.g. the solid phase in solid-liquid phase transitions
- ▶ \mathcal{R}_e a symmetric positive definite **elasticity tensor** (set $\mathcal{R}_e \equiv \mathbb{I}$)
- ▶ c_V , ϑ_c , λ and $\nu (> 0)$ the specific heat, the equilibrium temperature, the latent heat of the system, and the interfacial energy coefficient (set $c_V = \nu = \lambda/\vartheta_c = 1$)
- ▶ $W(\chi) + (\nu/2)|\nabla\chi|^2$ a **mixture or interaction free-energy**

The equation of macroscopic motion

The **equation of macroscopic motion** is the following stress-strain relation, taking into account of accelerations:

$$\mathbf{u}_{tt} - \operatorname{div} \boldsymbol{\sigma} = \mathbf{f} \quad \text{in } \Omega \times (0, T)$$

where \mathbf{f} stands for the exterior volume force and $\boldsymbol{\sigma}$ is the stress tensor. Using the constitutive law

$$\boldsymbol{\sigma} = \boldsymbol{\sigma}^{nd} + \boldsymbol{\sigma}^d = \frac{\partial \Psi}{\partial \boldsymbol{\varepsilon}(\mathbf{u})} + \frac{\partial \Phi}{\partial \boldsymbol{\varepsilon}(\mathbf{u}_t)},$$

the tensor $\boldsymbol{\sigma}$ can be written as

$$\boldsymbol{\sigma} = (1 - \chi)\boldsymbol{\varepsilon}(\mathbf{u}) + \chi\boldsymbol{\varepsilon}(\mathbf{u}_t) \quad \text{in } \Omega \times (0, T).$$

We treat here a *pure displacement* boundary value problem for \mathbf{u}

$$\mathbf{u} = \mathbf{0} \quad \text{on } \partial\Omega \times (0, T).$$

However, our analysis carries over to other kinds of boundary conditions on \mathbf{u} like a *pure traction* problem or a *displacement-traction* problem.

Formulation of the Problem

Find functions $\vartheta, \chi : \Omega \times [0, T] \rightarrow \mathbb{R}$ such that

$$\chi(x, t) \in \text{dom}(W) \text{ and } \vartheta(x, t) > 0 \text{ a.e. in } \Omega \times (0, T)$$

and $\mathbf{u} : \Omega \times [0, T] \rightarrow \mathbb{R}^3$ fulfilling the initial conditions:

$$\vartheta(0) = \vartheta_0 \quad \text{in } \Omega$$

$$\chi(0) = \chi_0 \quad \text{in } \Omega$$

$$\mathbf{u}(0) = \mathbf{u}_0, \quad \mathbf{u}_t(0) = \mathbf{v}_0 \quad \text{in } \Omega$$

the equations a.e. in $\Omega \times (0, T)$:

Proof of Thm. 2.

Open problems

Hypothesis 1. Assume that(i) the potential W is given by

$$W = \widehat{\beta} + \widehat{\gamma}, \text{ where } \widehat{\gamma} \in C^2([0, 1]) \text{ and}$$

$$\overline{\text{dom}(\widehat{\beta})} = [0, 1], \widehat{\beta} : \text{dom}(\widehat{\beta}) \rightarrow \mathbb{R} \text{ is proper, l.s.c., convex,}$$

$$\widehat{\beta} \in C_{\text{loc}}^{1,1}(0, 1)$$

(ii) the data satisfy

$$g \in H^1(0, T; L^2(\Omega)), \quad g(x, t) \geq 0 \text{ for a.e. } (x, t) \in \Omega \times (0, T)$$

$$\mathbf{f} \in L^2(0, T; L^2(\Omega))$$

$$\vartheta_0 \in H_N^2(\Omega) \quad \text{and} \quad \min_{x \in \overline{\Omega}} \vartheta_0(x) > 0, \quad \chi_0 \in H_N^2(\Omega)$$

$$\mathbf{u}_0 \in H_0^2(\Omega), \quad \mathbf{v}_0 \in H_0^1(\Omega)$$

(iii) the datum χ_0 is “separated from the potential barriers”

$$\min_{x \in \overline{\Omega}} \chi_0(x) > 0,$$

$$\max_{x \in \overline{\Omega}} \chi_0(x) < 1.$$

Proof of Thm. 2.

Open problems

First step.

- ▶ Following the approach of [BONETTI, SCHIMPERNA, SEGATTI, '05], we fix a constant $\sigma \in (0, 1)$ such that

$$\sigma \leq \frac{2}{3} \min \left\{ \min_{x \in \bar{\Omega}} \chi_0(x), 1 - \max_{x \in \bar{\Omega}} \chi_0(x) \right\},$$

and we introduce the truncation operator

$$T_\sigma(r) := \max\{r, \sigma\} \quad \forall r \in \mathbb{R}$$

- ▶ Hence, we consider the PDE system where (EQ3) is replaced by

$$\mathbf{u}_{tt} - \operatorname{div} (T_\sigma(1 - \chi)\varepsilon(\mathbf{u}) + T_\sigma(\chi)\varepsilon(\mathbf{u}_t)) = \mathbf{f}.$$

We shall prove the **existence of a local-in-time solution** to this truncated system **by a Schauder** fixed point argument

Hypothesis 1

The 3D case: local
well-posedness

Proof of Thm. 1

Hypothesis 2

The 1D case: global
well-posedness

Proof of Thm. 2.

Open problems

- ✓ In this case no separation condition of χ_0 from 1 is needed
- ✓ We do not need in this case the assumption $\hat{\beta} \in C_{\text{loc}}^{1,1}(0, 1)$ and so $\partial\hat{\beta}$ has to be regarded as a truly multivalued nonlinearity
